ABSTRACT Gene editing refers to a new technology for site specific modification of the genome. Using this technology you can accurately locate a certain site in the genome cut the target DNA or RNA fragment at this site and insert a new gene fragment. This process simulates the natural mutation of genes by artificial means and then achieves the purpose of modifying and editing the original genome of the organism. Since its birth gene editing technology has experienced five generations of development the technology has become more and more mature and the editing accuracy has also been improved. It has been more and more widely used in various biological fields including disease treatment and has become a research hotspot in recent years. This article briefly reviews the progress of researches on gene editing technology and the therapeutic applications.

KEY WORDS Gene editing Therapeutic application

ABSTRACT Objective To establish a national reference material for HLA B27 nucleic acid detection. Methods Fresh peripheral blood of HLA B27 positive and negative volunteers was collected transformed with EB virus and cultured to establish immortalized cell lines. The genomic DNA was extracted from the cells and prepared for the national reference material which was verified by the next generation sequencing technology. Moreover the accuracy of the national reference was verified by fluorescence PCR PCR SSP method and SBT sequencing method with HLA B27 nucleic acid detection reagents from four collaborative manufacturers. The stability after 3 cycles of freezing and thawing at - 20 and 25 and homogeneity of the national reference materials were studied as well. Results The national reference materials of HLA B27 were successfully prepared including 3 HLA B27 positive DNA samples and 7 HLA B27 negative DNA samples. The reference materials were accurately valued by SBT sequencing and other methods and the homogeneity of reference material was consistent. The reference material is stable after 3 cycles of freezing thawing which met the requirements of the national reference material. Conclusion All indexes of the national reference material for human leukocyte antigen B27 nucleic acid detection meet the requirements and can be used for the performance evaluation of human leukocyte antigen B27 nucleic acid detection kit.

ABSTRACT Objective Using a multiple ligation dependent probe amplification method MLPA to detect chromosomes in abortive embryos and the genetic etiology of abortion was analyzed in combination with maternal age gestational age to assist in further genetic counseling. Methods The villus tissue samples of spontaneous abortion embryos in early pregnancy were collected and genomic DNA was extracted and tested using two kit probes MLPA P036 P070 combined with further analysis of statistics such as age and gestational age. Results A total of 774 samples were collected in this study with a detection success rate of 98.97% 766/774 and an abnormal detection rate of 52.09% 399/774 . The chromosomal aneuploidy anomaly was 50.26% the karyotype 47 XN +16 were the most common. Chromosomal monomer chromosome trisomes chimeras other complex aneuploids deletion/duplication chromosomes and other chromosomal abnormalities were detected. Pregnant women have higher abortion rates in the age group of less than 20 years

CTCs in breast cancer patients with tumors not smaller than 2 cm was higher than that with tumors smaller than 2 cm the differences were statistically significant N : 0.05 . The positive rate of cfDNA in patients with lymph node metastasis was higher than that without lymph node metastasis the differences were statistically significant N : 0.05 . At 3 years after surgery positive rates of CTCs and cfDNA in the disease progression group were higher than those in the disease non progression group N<0.05 . Conclusion Blood CTCs and cfDNA detection have high diagnostic value for breast cancer and are closely related to the clinical pathological characteristics and prognosis of patients.

were observed in the three groups and their correlation was analyzed. Results Serum vascular endothelial growth factor VEGF interleukin 18 IL 18 monocyte chemoattractant protein 1 MCP 1 levels of patients in the severe PE group were significantly higher than those in the mild PE group and the control group N<0.05 . The levels of arachidonic acid induced maximum platelet aggregation rate AA hematocrit HCT and D dimer DD of patients in the severe PE group were significantly higher than those in the mild PE group and the control group. The levels of AA HCT and D D increased with the severity of the disease and the difference was statistically significant N<0.05 . Correlation analysis showed that AA HCT D D VECG IL 18 and MCP 1 were all positively correlated N<0.05 . Conclusion As the disease progresses in patients with preeclampsia serum VEGF IL 18 MCP 1 levels increase. VEGF IL 18 MCP 1 and hemorheological indicators are positively correlated which can be used to judge the condition of patients with preeclampsia Predictive indicators.

ABSTRACT Objective To evaluate the clinical value of soluble fibrinogen like protein 2 sFGL2 in peripheral blood of patients with chronic hepatitis B CHB . Methods Enzyme linked immunosorbent assay and real time fluorescent quantitative PCR were detected the levels of plasma sFGL2 and qDEJ0 mRNA in peripheral blood of 140 CHB patients CHB group in which 25 cases were treated with antiviral drugs antiviral group ɵ42 HCV patients CHC group and 48 healthy cases control group comparing the differences among those groups Spearman correlation was analyzed between sFGL2 level and clinical indexes in CHB patients estimating the differences in the levels of plasma sFGL2 and qDEJ0 mRNA before and after antiviral treatment in antiviral group of 25 cases. Results The levels of plasma sFGL2 and qDEJ0 mRNA in the CHB group were higher than those in the CHC group and the control group the difference were statistically significant N<0.05 no statistical difference between the CHC group and the control group in plasma sFGL2 and qDEJ0 mRNA N>0.05. Spearman correlation analysis showed that sFGL2 concentration and qDEJ0 mRNA expression were positively correlated with HBV DNA ALT and AST N<0.05 but not correlated with GGT T Bil and AFP N>0.05 . The concentration of sFGL2 and the expression of qDEJ0

mRNA after antiviral treatment were significantly lower than before antiviral treatment and the difference was statistically significant N<0.05 . Conclusion SFGL2 is significantly increased in CHB patients which is closely related to the abnormalities of HBV DNA load ALT and AST and sFGL2 is significantly decreased after antiviral treatment.

LIU Hui FANG Huiqin CHEN Wei YAN Yalan YUAN Jing
Prenatal Diagnosis Center of Obstetrics and Gynecology the First Affiliated Hospital of Anhui Medical University Hefei Anhui China 230022

ABSTRACT Objective To explore the value of amniocentesis in the prenatal diagnosis of chromosomal abnormalities in non invasive high risk cases of prenatal screening. Methods A total of 105 non invasive high risk cases of prenatal screening admitted to our hospital from January 2017 to December 2019 were selected as the research objects and genetic counseling was given. After the patient s informed consent amniocentesis karyotype analysis was performed. Based on the clinical follow up results statistical amniocentesis karyotype analysis was performed to detect various types of chromosomal abnormalities 13 trisomy syndrome 18 trisomy syndrome 21 trisomy syndrome sex chromosomes etc. and the sensitivity accuracy and specificity of diagnosing various types of chromosomal abnormalities. Receiver operating characteristic curve ROC and area under ROC AUC were used to analyze the efficacy of amniotic fluid puncture karyotype analysis for diagnosis of total chromosomal abnormalities. Results Among 105 non invasive high risk cases of prenatal screening there were 83 cases of chromosomal abnormalities in clinical

follow up including 9 cases of 13 trisomy syndrome 13 cases of 18 trisomy syndrome 51 cases of 21 trisomy syndrome and 10 cases of sex chromosome abnormalities. Based on the clinical follow up results the sensitivity of amniocentesis karyotype analysis for 13 trisomy syndrome was 88.89% the accuracy was 96.19% and the specificity was 96.88%. Amniotic fluid puncture karyotype analysis for the diagnosis of 18 trisomy syndrome had a sensitivity of 92.31% accuracy of 99.05% and specificity of 100.00%. The sensitivity of amniocentesis karyotype analysis for diagnosis of 21 trisomy syndrome was 98.04% accuracy was 97.14% and specificity was 96.30%. Amniotic fluid puncture karyotyping analysis had a sensitivity of 90.00% an accuracy of 98.10% and a specificity of 98.95% the sensitivity of amniocentesis karyotype analysis for diagnosis of total chromosomal abnormalities was 95.18% specificity was 72.73% and accuracy was 90.48%. Conclusion Amniotic fluid puncture has a high prenatal diagnosis value for chromosomal abnormalities in NIPT high risk populations and can provide a reliable reference for eugenics and postnatal care genetic counseling.

ABSTRACT Objective To explore the relationship between Th1/Th2 cell imbalance and disease severity lung injury in patients with sepsis. Methods Sixty two patients with sepsis who were treated in ICU of the hospital from October 2017 to October 2019 were divided into the death group 20 cases and the survival group 42 cases according to the clinical outcomes after 28 d of treatment. At 1 d before entering ICU and at 1 7 and 14 d after entering ICU contents of Th1 cells IFN ⁺CD3⁺CD4⁺ T lymphocytes and Th2 cells IL 4⁺ CD3⁺CD4⁺T lymphocytes in peripheral venous blood in both groups were detected by flow cytometry. The ratio of Th1/Th2 was calculated. The contents of Th1 and Th2 cells and Th1/Th2 were analyzed and compared between the two groups. According to presence or absence of lung injury they were further divided into the lung injury group 24 cases and lung non injury group 38 cases . The contents of Th1 and Th2 cells and Th1/ Th2 were analyzed and compared between the two groups. Results At 1 7 and 14 d after treatment contents of Th1 cells and Th1/Th2 in the survival group were significantly higher than those in the death group N< 0.05 while differences in contents of Th2 cells were not statistically significant between the two groups N>

0.05 . The contents of Th1 cells and Th1/Th2 in the lung injury group were significantly higher than those in the lung non injury group N : 0.05 while the differences in contents of Th2 cells were not statistically significant between the two groups N<0.05 . Conclusion The decrease of Th1/Th2 ratio indicates the aggravation of disease severity and poor prognosis. The pro inflammatory Th1 cells are increased in patients with sepsis and lung injury and the Th1/Th2 balance drifts to Th1.

ABSTRACT Objective To investigate the relationship between serum microRNA nucleotide miRNA 4534 level and pathological staging and prognosis of patients with lung cancer. Methods Sixty four patients with lung cancer lung cancer group who were treated between January 2014 and June 2016 were selected a ˜ Ą Ţ ê anetшлъфŭt wer aђr é r c ô ϓ ˜ ȳ ϑ ϑ ϐ ϐ ϐ

miRNA 4534 and pathological features in patients with lung cancer was analyzed. At 3 years of follow up the relationship between miRNA 4534 and prognosis of patients with lung cancer was evaluated. Results The relative expression level of miRNA 4534 in the lung cancer group was higher than that in the benign lung disease group and the control group the difference was statistically significant N<0.05 and there was no significant difference in the relative expression level of miRNA 4534 between the benign lung disease group and the control group the difference was not statistically significant N>0.05 . ROC curve showed that the area under the curve AUC optimal cut off value sen

ABSTRACT Objective To analyze the predictive value of serum calcium ions alkaline phosphatase ALP and cytokeratin 19 fragment 21 1 CYFRA21 1 for bone metastases of lung cancer. Methods Between January 2017 and July 2019 " G @ @ Đ C M Rp ð . FaÂ Đ p 4 ÄP a20 4PaÅ p G % F SpN B UsPĎO Þ F `O ˜Đ ‘ 9

types of lung cancer were compared. Serum levels of calcium ion ALP and CYFRA21 1 were compared between patients with and without bone metastasis and patients with different degrees of bone metastases. The receiver operating characteristic ROC curves were used to analyze the predictive value of serum calcium ion ALP and CYFRA21 1 in bone metastases from lung cancer. Results The incidence of bone metastases in this study was 44.88% 57/127 . The incidence of bone metastases from adenocarcinoma was significantly higher than those from squamous cell carcinoma small cell carcinoma and adenosquamous carcinoma. However there were no significant differences in the incidences of bone metastases from squamous cell carcinoma small cell carcinoma and adenosquamous carcinoma N<0.05 . Serum levels of calcium ion ALP and CYFRA21 1 were significantly higher in lung cancer patients with bone metastasis than in those without bone metastasis N : 0.05 and significantly higher in patients with multiple bone metastases than in those with single bone metastasis N<0.05 . In terms of single index diagnosis the area under the curve AUC of ALP was the largest with >95.23 U/L as the cut off value. And its sensitivity and specificity for predicting bone metastases from lung cancer were 57.89 % and 70.00%. The AUC of combined prediction was 0.765 significantly larger than that of each index single prediction N<0.05 . With >0.459 as the cut off value the sensitivity and specificity for predicting bone metastases from lung cancer were 70.18 % and 70.00% . Conclusion Combined prediction of serum calcium ion ALP and CYFRA21 1 can improve the prediction efficiency which is better for early warning of lung cancer bone metastases.

underwent a physical examination in our hospital were included as the control group. The levels of arrestin2 RBP4 and FGF 21 in 3 groups were compared and the correlation between arrestin2 RBP4 and FGF 21 and glucose and lipid metabolism in patients with type 2 diabetic foot was analyzed. Results The level of arrestin2 in the group A was lower than that of the group B and the control group and the levels of RBP4 and FGF 21 in the group A were higher than those of the group B and the control group. The difference was statistically significant N<0.05 . The levels of HbAlc TC TG LDL C HOMA IS and HOMA IR in the group A were higher than those in the group B and the control group and the differences were statistically significant N<0.05 while the levels of HDL C in the three groups were no significantly difference N>0.05 . Plasma arrestin2 levels were significantly negatively correlated with HbAlc TC TG LDL C HOMA IR BMI FFA and HOMA IS levels N<0.05 . The levels of RBP4 and FGF 21 were significantly positively correlated with the levels of HbAlc TC TG LDL C HOMA IR BMI FFA and HOMA IS N<0.05 . Conclusion arrestin2 RBP4 and FGF 21 are abnormally expressed in type 2 diabetic foot and their levels are closely related to the metabolism of glucose and lipid. All three promote the development of type 2 diabetic foot and are expected to become a new target in the treatment of type 2 diabetic foot.

ABSTRACT Objective To study the value of peripheral blood miR 23b 3p expression level in evaluating the condition and prognosis of children with severe pneumonia. Methods From June 2017 to December 2019 180 cases of children with pneumonia were selected 76 children with severe pneumonia were enrolled in the severe pneumonia group 104 children with common pneumonia were enrolled in the common pneumonia group and 80 healthy children in the same period were selected as the control group. The expression of miR 23b 3p in peripheral blood was detected by fluorescence quantitative PCR. The serum contents of tumor necrosis factor TNF interleukin 6 IL 6 and interleukin 10 IL 10 were detected by enzyme linked immunosorbent assay. The 28 day survival was observed. The difference of cumulative survival rate was compared by KM curve and the value of miR 23b 3p in predicting survival was analyzed by ROC curve. Result The expression level of peripheral blood miR 23b 3p in the severe pneumonia group was lower than that of the common pneumonia group and the control group. The WBC ESR CRP levels APACHE II score

serum TNF IL 6 IL 10 contents in children with low miR 23b 3p expression in the severe pneumonia group were higher than those of children with high mir 23b 3p expression and the 28d cumulative survival rate was lower than that of children with high mir 23b 3p expression. ROC curve analysis showed that mir 23b 3p had predictive value for the 28 day survival of children with severe pneumonia. Conclusion the low expression of miR 23b 3p in peripheral blood of children with severe pneumonia is related to the aggravation of the disease and the activation of inflammatory reaction and it is valuable for evaluating the survival prognosis of 28 days.

N : 0.05 . There was a positive correlation between serum IL 17A Betatrophin sCD68 and homa insulin resistance index HOMA IR serum luteinizing hormone LH /follicle stimulating hormone FSH anti Müllerian hormone AMH the difference was statistically significant N<0.05 . There was a negative correlation between serum IL 17A Betatrophin sCD68 HOMA IR LH/FSH and ovarian reactivity and a positive correlation between serum AMH and ovarian reactivity the difference was statistically significant N< 0.05 . After controlling for HOMA IR LH/FSH AMH and other factors serum IL 17A Betatrophin and sCD68 were still significantly correlated with ovarian reactivity and the difference was statistically significant N<0.05 . Conclusion The levels of serum IL 17A Betatrophin and sCD68 in PCOS patients are significantly increased which are closely related to the patient s ovarian function and insulin resistance and are negatively related to the patient s ovarian response to ovulation induction therapy.

group and 25 hydroxyvitamin D was significantly lower than that of the control group The difference was statistically significant N<0.05 blood gas analysis the level of $PaCO_2$ in OSAHS group was higher than that in normal control group while PaO_2 SaO_2 and pH levels were lower than those in normal control group the difference was statistically significant N<0.05 sleep structure sleep latency total time of awakening and times of awakening were greater than those of normal control group and total sleep time was shorter than that of normal control group the difference was statistically significant N<0.05 The number of apnea times of hypoventilation and AHI in OSAHS group were significantly higher than those in control group N<0.05 . Pearson test showed that serum ADMA and BMI were positively correlated with the severity of OSAHS while 25 hydroxyvitamin D was the opposite. Conclusion The increase of ADMA BMI and the decrease of 25 hydroxyvitamin D can directly lead to the generation and development of OSAHS. It is important to control and improve ADMA 25 hydroxyvitamin D and BMI for the prevention and treatment of OSAHS.

ABSTRACT Objective To analyze the correlation between level of high risk human papilloma virus hrHPV E6/E7mRNA load and cervical intraepithelial neoplasia CIN . Methods A total of 176 patients who were diagnosed with cervical lesions in our hospital from December 2016 to June 2019 were

retrospectively analyzed. Among them there were 144 cases in CIN group 62 cases at grade I 45 cases at grade 37 cases at grade and 32 cases in the cervical cancer group. Another 50 patients with chronic cervicitis who were admitted during the same period were enrolled as the chronic cervicitis group. The cervical deciduous epithelial cells were collected aseptically. The grades of cervical cytology Bethesda System TBS were detected by Thinprep cytology test TCT . The levels of 13 hrHPV DNA loads were detected by hybrid capture HC . The levels of the 14 kinds of HrHPV E6/E7 mRNA load were detected by branched chain DNA. The differential diagnosis values of hrHPV E6/E7 mRNA and hrHPV DNA load in CIN was analyzed by ROC curves. The correlation between hrHPV E6/E7 mRNA hrHPV DNA load and severity of CIN lesions was analyzed by Pearson correlation analysis. Results The hrHPV DNA and hrHPV E6/E7 mRNA load were the highest in the cervical cancer group followed by the CIN group and the chronic cervicitis group N< 0.05 . AUC of hrHPV E6/E7 mRNA for differential diagnosis of CIN and chronic cervicitis was 0.816 N< 0.05 AUC of hrHPV DNA for differential diagnosis of CIN and chronic cervicitis was 0.561 N>0.05 AUC values of hrHPV E6/E7 mRNA and hrHPV DNA load for differential diagnosis of CIN and cervical cancer were 0.736 and 0.698 respectively N<0.05 . With the increase of TBS and CIN grades hrHPV DNA and hrHPV E6/E7 mRNA load were significantly increased N<0.05 . Both hrHPV E6/E7 mRNA and hrHPV DNA load were significantly positively correlated with severity of CIN lesions p ; 0.285 0.621. N<0.05 . Conclusion The level of hrHPV E6/E7 mRNA load has a significant correlation with the severity of CIN lesions and can be applied for the differential diagnosis of CIN and lesions assessment.

ABSTRACT Objective To explore the relationship between levels of serum 25 hydroxyvitamin D 25 OHD and interleukin 17 IL 17 and diabetic retinopathy DR . Methods 348 patients with diabetes mellitus DM admitted between January 2018 and December 2019 were selected for this study. According to the results of fundus examination they were divided into the diabetic retinopathy group DR group l=140 and the non diabetic retinopathy group NDR group l=208 . The levels of disease related indicators glycosylated hemoglobin HbA1C low density lipoprotein cholesterol LDL C systolic blood pressure SBP superoxide dismutase SOD and 25 OHD and IL 17 were compared between the DR group and the NDR group. Spearman analysis was used to analyze the correlation between disease severity and levels of 25 OHD and IL 17 in the DR group. Pearson analysis was used to analyze the correlation between 25 OHD IL 17 and disease related indicators in the DR group and logistics regression analysis was used to analyze the influencing factors of DR occurrence. Results The levels of HbA1C LDL C SBP and IL 17 in the DR group were higher than those in the NDR group N<0.05 while the levels of SOD and 25 OHD in the DR

group were lower than those in the NDR group N : 0.05 . Spearman correlation analysis showed the disease staging of DR patients was negatively correlated with 25 OHD N : 0.05 positively correlated with IL 17 level N : 0.05 . Pearman correlation analysis showed that 25 OHD was negatively correlated with HbA1C and SBP N : 0.05 and positively correlated with SOD N<0.05 and not correlated with LDL C N<0.05 . IL 17 was positively correlated with HbA1C LDL C and SBP N : 0.05 and negatively correlated with SOD N : 0.05 . Logistics regression analysis showed that IL 17 was a risk factor affecting DR N : 0.05 and SOD was a protective factor affecting DR N : 0.05 . Conclusion 25 OHD and IL 17 are closely related to the occurrence and progression of DR. Monitoring the two indicators of DM patients has certain clinical value.

ABSTRACT Objective To explore the value of serum C1q tumor necrosis factor related protein CTRP1 and uric acid SUA levels in the clinical diagnosis of coronary heart disease. Methods 140 patients with coronary heart disease admitted between January 2019 and December 2019 were selected as the research subjects observation group and the patients in observation group were divided into the myocardial infarction group AMI group l=46 the unstable angina group UA group l=75 and the chronic stable angina pectoris group SAP group l=19 according to the types of disease. Another 50 healthy people who underwent physical examination during the same period were selected as the control group. The general data gender age body mass index BMI systolic blood pressure blood creatinine SCr total cholesterol TC triglycerides TG low density lipoprotein cholesterol LDL C and levels of serum CTRP1 and SUA

were compared between the two groups. Levels of serum CTRP1 and SUA were compared among patients with different types of coronary heart disease. The efficacy of serum CTRP1 and SUA was analyzed in the diagnosis of coronary heart disease. The relationship between the disease severity of patients with coronary heart disease and serum CTRP1 and SUA levels was analyzed. Results There were no significant differences in SCr and TC between the two groups N<0.05 and the BMI systolic blood pressure TG and SUA in the observation group were higher than those in the control group N<0.05 while the LDL C and CTRP1 in the observation group were lower than those in the control group N<0.05 . Comparison of CTRP1 level in the different groups showed that the control group > the SAP group > the UA group > the AMI group N<0.05 . Comparison of SUA level showed that the control group < the SAP group < the UA group < the AMI group N<0.05 . ROC curves showed that CTRPI and SUA were effective indicators in the diagnosis of coronary heart disease N<0.05 and the area under the curve of combined diagnosis of CTRPI and SUA was the largest. Comparison of CTRP1 level in patients with different lesion counts of coronary artery disease showed that three vessel disease < double vessel disease < single vessel disease < the control group N<0.05 . Comparison of SUA level showed that three vessel disease > double vessel disease > single vessel disease > the control group N<0.05 . Conclusion Serum CTRP1 and SUA are related to coronary heart disease patients and the number of vascular lesions. CTRP1 combined with SUA has a higher diagnostic efficiency for coronary heart disease.

ABSTRACT Objective To explore the expression of ASF1B in endometrial cancer and its relation ship with the malignant behavior of cells. Methods The tumor tissues and adjacent tissues of 68 patients with endometrial cancer diagnosed were collected. The real time fluorescence quantitative PCR qRT PCR was used to detect the expression of ASF1B in these tissues. Humacs p א é = Ȳ hav ŕ ƨ ƛ "

overexpression group the recovery group significantly decreased in vitro proliferation and metastasis ability and the levels of FOXM1 CDK6 and VEGFB were significantly reduced. Compared with the non sense group the proliferation and metastasis ability of cells in the interference group were significantly reduced and the expression levels of FOXM1 CDK6 and VEGFB were significantly decreased N<0.01 . Conclusion ASF1B can promote the expression of FOXM1 promote the proliferation and metastasis of endometrial cancer cells and enhance their malignant phenotype.

ABSTRACT Objective To investigate the relationship between the expression of CD56 and the clinicopathological features of thyroid papillary carcinoma PTC and its predictive value for distant metastasis. Methods From January 2014 to March 2015 184 PTC patients who underwent surgical resection in our hospital were selected as the PTC group while 78 nodular goiter patients who underwent surgical resection in our hospital at the same time were selected as the control group Ж50 anB c as v ɔ ȳ ᴅ meta tasis.

HUBnÊÀ@ÆÊÅOVÆpÕW` Po Ê@n v@%ðÆ ɔ

metastasis and capsule invasion were the influencing factors for the survival without distant metastasis of PTC patients. Conclusion The increase of CD56 expression in PTC is closely related to the deterioration of pathological characteristics and the occurrence of distant metastasis.

ABSTRACT Objective To study the correlation between hypoxia inducible factor 1 HIF 1 vascular endothelial growth factor VEGF and tissue inhibitor of matrix metalloproteinases TIMP and pressure injury after heart valve replacement. Methods 161 patients after heart valve replacement in our hospital from February 2019 to January 2020 were selected. The levels of HIF 1 VEGF TIMP and their correlation with the stage of pressure injury were compared in different patients. The sensitivity specificity and accuracy of HIF 1 VEGF and TIMP alone and combined detection for the prediction of postoperative

ABSTRACT Objective To observe the predictive value of gestational sac diameter/crown rump length SD/CRL ratio combined with serum human chorionic gonadotropin HCG and estradiol E2 levels in early abortion of patients undergoing in vitro fertilization/intracytoplasmic sperm injection embryo transfer IVF/ICSI ET . Methods A retrospective analysis was performed among 328 patients receiving IVF/ ICSI ET in the hospital. The levels of serum HCG and E2 SD/CRL ratio and clinical data were compared between the early abortion group and the non early abortion group. Influencing factors of early abortion were analyzed. The predictive value of SD/CRL ratio combined with serum HCG and E2 levels for early abortion was discussed. Results Theserum HCG and E2 levels of the early abortion group were significantly lower than those of the non early abortion group N<0.05 while SD/CRL ratio was significantly higher than that of

the non early abortion group N<0.05 . The early abortion rate in >35 years old group was significantly higher than that in 30~35 years old and <30 years old groups and the 30~ 35 years old group was significantly higher than those under 30 years old group N<0.05 . Age and SD/CRL ratio were independent risk factors for early abortion N<0.05 while serum HCG and E2 at 14d after transplantation are protective factors N<0.05 . The sensitivity and specificity of E2 HCG SD/CRL ratio and their combination for predicting early abortion were 81.7% 71.5% 82.8% 79.3% 86.9% 73.1% and 91.7% 89.2% respectively. Conclusion The SD/CRL ratio combined with serum HCG and E2 can provide an important basis for the prediction of early abortion of patients undergoing IVF/ICSI ET which is of great significance for clinical practice.

ABSTRACT Objective To explore the effect and mechanism of down regulation of miR 4262 on the metastatic potential of lung cancer cell A549. Methods qRT PCR was used to detect miR 4262 expression in lung cancer cells. Lung cancer cell A549 were transfected with miR 4262 inhibitor MTT was used to measure proliferation transwell cells were used to measure invasion and migration and western blot analysis was used to measure E cadherin and vimentin protein expression. Bioinformatics software predicts that miR 4262 and KLF3 have binding sites at the 3 UTR end and the luciferase system identifies the targeting relationship. qRT PCR was used to detect changes in the expression of KLF3 mRNA in lung cancer tissues and to analyze the correlation between its expression level and miR 4262. Lung cancer cells A549 were transfected with miR 4262 inhibitor and KLF3 siRNA to detect cell proliferation invasion and migration changes. Results The expression level of miR 4262 was increased in lung cancer tissues and lung cancer cells. After transfection with miR 4262 inhibitor lung cancer cell A549 had reduced proliferation invasion and migration ability and the expression level of E cadherin protein in the cells increased while the level of vimentin decreased. Down regulation of miR 4262 up regulated the expression of KLF3 in lung cancer cell A549. KLF3 siRNA can reverse the inhibitory function of miR 4262 inhibitor on the proliferation invasion and migration of lung cancer cell A549. Conclusion Down regulation of miR 4262 inhibits the metastatic potential of lung cancer cell A549 and the mechanism of action is related to the targeted up regulation of KLF3 expression.

control group and the level of Hcy was significantly higher than that of the control group and the difference was statistically significant N : 0.05 . Conclusions The levels of IGF 1 IGFBP 3 and Hcy have a certain correlation with children s IQ height and weight. Children with CH can return to normal levels after early diagnosis and treatment.

DU Xiangyang [1 2] ZHANG Wenying [3] YAN Lin [1]
1. Department of Infectious Diseases Shandong Provincial Third Hospital Jinan Shandong China 250031 2. Department Of Emergency Shandong Provincial Third Hospital Jinan Shandong China 250031 3. Medical Insurance Office Shandong Provincial Third Hospital Jinan Shandong China 250031

ABSTRACT Objective To study the significance of neutrophil CD64 combined with blood routine in diagnosis and differential diagnosis of infectious and non infectious fever in severe patients. Methods A total of 155 fever patients who were treated in the hospital from between January 2015 and January 2019 were enrolled. According to different fever causes they were divided into the infectious fever group 75 cases and the non infectious fever group 80 cases . The levels of neutrophil CD64 indexes in peripheral blood were detected by flow cytometry. The levels of white blood cells WBC procalcitonin PCT and C reactive protein CRP in peripheral blood were detected by blood analyzer. The diagnostic efficiency of blood routine indexes was compared by ROC curves. Results After admission the 24 hour CD64 index and 1 week CD64 index of the infected fever group were significantly higher than those of the non infected fever group the difference was statistically significant N<0.05 . The sensitivity of CD64 index and WBC to diagnose

infectious and non infectious fever was significantly higher than that of PCT and CRP and the difference was statistically significant N<0.05 . The specificity of CD64 index and WBC in diagnosing infectious fever and non infectious fever was significantly higher than that of PCT and CRP and the difference was statistically significant N<0.05 . Conclusion The CD64 index and WBC levels of patients with infectious fever are significantly increased and these two indicators are highly specific and sensitive in the diagnosis of infectious fever and non infectious fever and have high diagnostic value.

serum Lp PLA2 and AT levels and Gensini scores among the mild moderate and severe groups N< 0.05 . Spearman correlation analysis showed that serum Lp PLA2 was positively correlated with Gensini score in ACS patients p ; 0.283 N ; 0.040 while AT was negatively correlated with Gensini score p ; - 0.331 N ; 0.016 . ROC curve analysis showed that the area under the curve AUC of Lp PLA2 combined with AT 0.872 for predicting severe coronary artery stenosis in ACS patients was higher than that of single indicator detection. Conclusion With the aggravation of coronary artery stenosis the Gensini scores and serum Lp PLA2 level are increased while serum AT level is decreased in ACS patients. The combined detection of Lp PLA2 and AT can provide a more accurate judgment for the degree of coronary stenosis in patients with acute coronary syndrome.

serum albumin and prothrombin activity in the hepatorenal syndrome group were all lower than the severe hepatitis group the difference was statistically significant N<0.01 . Based on the three factors to construct a multi factor risk score to get the formula risk score =14.35+0.56×NGAL level+0.50×LFABP level+0.46×NAG level NGAL The AUC values of LFABP and NAG for the diagnosis of hepatorenal syndrome are 0.703 95% confidence interval 0.606 0.799 0.775 95% confidence interval 0.688 0.861 0.728 95% confidence interval 0.643 0.812 and The AUC value for the diagnosis of hepatorenal syndrome by risk score was 0.817 95% confidence interval 0.747~0.887 and the N values were all <0.001 the sensitivity of NGAL LFABP NAG and risk scoring models for the diagnosis of hepatorenal syndrome were 84.1% 81.8% 75.0% and 81.8% with specificities of 47.2% 72.6% 67.0% and 74.5% and accuracy of 31.3% 54.4% 42.0% and 56.3% respectively. Conclusion The risk scoring model based on serum NAG NGAL and LFABP has satisfactory diagnostic efficacy for hepato renal syndrome in elderly patients with severe hepatitis B.

correlated with the degree of differentiation and negatively correlated with tumor T stage tumor size and lymph node metastasis N : 0.05 . The expression level of fRadỵ2 mRNA and catenin were negatively correlated with the degree of differentiation and positively correlated with tumor T stage tumor size and lymph node metastasis N : 0.05 . The expression level of miRNA 320a in the survivors was higher than that in the dead and the expression level of fRadỵ2 mRNA and catenin was lower than that in the dead N : 0.05 there were significant differences in the survival curves of miRNA 320a fRadỵ2 mRNA catenin expression level between high risk and low risk patients *P* : 0.05 . There was a negative correlation between the expression level of miRNA 320 and fRadỵ2 mRNA and catenin N : 0.05 . Conclusion The expression of miRNA 320a in liver cancer tissue is low and the expression of hTcf 4 and catenin are high which are related to the degree of differentiation tumor T stage tumor size and lymph node metastasis and can predict patient prognosis.

ABSTRACT Objective To explore the clinical significance of Cystatin C Cys C and CT value of renal effusion in patients with obstructive empyema of urinary tract stones. Methods A total of 138 patients with obstructive hydronephrosis of urinary tract stones in our hospital were selected including 87 patients with renal empyema as the study group and 51 patients with hydronephrosis as the control group. The general data of the two groups were statistically compared. The renal function indexes blood urea nitrogen BUN creatinine CR serum Cys C and CT value of renal effusion of the two groups were detected and compared. The correlation between serum Cys C and CT value of renal effusion and the relationship between the two and renal function indexes was analyzed and the diagnostic value was analyzed and the diagnostic value of serum Cys C and CT value of hydronephrosis on urinary tract stone obstructive empyema and hydronephrosis was explored. Results The serum BUN and Cr levels of the research group were higher than those of the control

group N<0.05 the CT values of the serum Cys C and renal effusion in the research group were higher than those in the control group N<0.05 . Serum Cys C was positively correlated with CT value of renal effusion N< 0.05 serum Cys C and CT value of renal effusion were positively correlated with serum BUN and Cr levels N<0.05 . The area under the curve AUC of the combined diagnosis of serum Cys C and CT value of renal effusion combined with the differential diagnosis of urinary tract stone obstructive empyema and hydronephrosis was 0.841 which was greater than the single diagnosis of the two the best diagnostic sensitivity of combined diagnosis was 68.63% and specificity was 86.21% . Conclusion Serum Cys C level and CT value of hydronephrosis in patients with urinary tract stone obstructive empyema are abnormally increased and are positively correlated with the patient s renal function which can assist in the clinical differential diagnosis of urinary tract stone obstructive empyema and hydronephrosis guide clinical evaluation of patients renal function and develop targeted treatment plans.

WANG Haibin ZHANG Dongqing ZHAO Jiao
Department of Clinical Laboratory the Fourth Medical Center Chinese PLA General Hospital Beijing China 100048

ABSTRACT Objective To investigate the infection rate subtypes and age distribution of human papillomavirus HPV among women in Haidian District Beijing and to provide evidence for preventing HPV infection. Method A total of 3650 outpatient women from the Fourth Medical Center of Chinese PLA General Hospital were checked for 17 HPV DNA types by fluorescence quantitative PCR assay. The HPV infection age distribution of the subjects HPV infection rate and HPV subtypes were analyzed. Result Among 3650 women there were 825 cases of HPV infection and the infection rate was 22.60% including 745 cases of high risk subtypes and 172 cases of low risk subtypes and 92 cases of mixed infection of high and low subtypes accounting for 11.15% 92/825 . Female HPV infection is dominated by single infection a total of 553 cases accounting for 67.03% 533/825 and 272 cases of multiple infection accounting for 32.97% 272/825 . Women in different age groups show different subtypes of HPV infection. The top five high risk HPV infection subtypes were 52 6+11 16 58 and 51 subtypes. Conclusion Female HPV infections in Haidian District of Beijing are mainly HPV 52 HPV 6+11 and HPV 16 subtypes. The incidence trend is younger. Effective measures should be taken to reduce HPV infection.

ABSTRACT Objective To explore the relationship between the prognosis of cardiac function and the level of serum uric acid and CK MB after acute myocardial infarction. Methods 173 patients with acute myocardial infarction who were hospitalized in our department from January 2018 to December 2019 were selected. All patients were tested for blood uric acid and CK MB and the patients were assessed for end diastolic left ventricular diameter LVEDd end systolic left ventricular diameter LVEDs left ventricular ejection fraction LVEF and Gensini coronary artery disease score depending on whether they had the hyperuricemia group was compared. Results The general clinical data of the two groups of patients were balanced and comparable and the difference was not statistically significant N<0.05 . The peak level of CK MB in patients with myocardial infarction combined with hyperuricemia was significantly higher than that of other patients N<0.05 . The peak time is earlier the SUA value of patients with different cardiac function Killip grades is different from the peak CK MB and the difference is statistically significant N<0.05 . The higher the Killip grade the higher the SUA value and the peak CK MB. The levels of SUA and CK MB peak

in patients with ST segment elevation myocardial infarction STEMI were significantly higher than those in patients with non ST segment elevation myocardial infarction NSTEMI N<0.05 The SUA value of patients with acute myocardial infarction was negatively correlated with the peak level of CK MB and LVEF it was positively correlated with LVEDs LVEDd and Gensini score the difference was statistically significant N< 0.05 . Conclusion The cardiac function and prognosis of patients with acute myocardial infarction can be assessed indirectly through SUA and CK MB values.

ABSTRACT Objective To investigate the effect of miR 22 3p on IL 1 induced chondrocyte injury and its mechanism. Methods Rat chondrocytes were isolated and cultured and IL 1 treated the cells for 48 h to construct a cell injury model. qRT PCR and Western blotting were used to detect the expression levels of miR 22 3p and TRIM8 in Con group IL 1 group IL 1 +miR NC group IL 1 +miR 22 3p group IL 1 +si NC group IL 1 +si TRIM8 group IL 1 +miR 22 3p+pcDNA group IL 1 +miR 22 3p+pcDNA TRIM8 group. The levels of IL 6 IFN and TNF in each group were detected by ELISA. Flow cytometry was used to detect the apoptosis rate of each group. The dual luciferase report assay was used to verify the targeted regulation of miR 22 3p and TRIM8. Western blotting was used to detect the expression of Bcl 2 and Bax in each group. Results Compared with the control group the expression levels of miR 22 3p and Bcl 2 protein in IL 1 treated cells were significantly reduced N<0.05 . The apoptosis rate was significantly increased N< 0.05 and the expression levels of TRIM8 and Bax and the levels of IL 6 IFN and TNF were significantly increased N<0.05 . Transfection of miR 22 3p mimics or transfection of si TRIM8 can significantly reduce the levels of IL 6 IFN TNF apoptosis rate and the protein level of Bax N<0.05

and increase the protein Level of Bcl 2 N<0.05 . The dual luciferase report experiment confirmed that miR 22 3p could target TRIM8. Co transfection of miR 22 3p mimics and pcDNA TRIM8 can significantly reduce the inhibitory effect of miR 22 3p mimics on cell apoptosis and inflammation. Conclusion miR 22 3p overexpression can target the inhibition of TRIM8 expression toreduce IL 1 induced chondrocyte inflammatory damage and inhibit cell apoptosis.

ABSTRACT Neuropathic pain NPP is a very common symptom in current society. However the mechanism of NPP is still unclear and there are no effective drugs which can effectively treat NPP. In recent years Transient Receptor Potential TRP channels are found to be involved in multiple intracellular responses. Transient Receptor Potential Vanilloid 1 TRPV1 isclosely related to NPP which makes its inhibitors as important drugs targeted for NPP. This article summarize the overview of NPP and the composition and function of the TRP channel family. The focus is on the research progress of TRPV1 inhibitors as targeted drugs in neuropathic pain and provides a new research direction for drug therapy of neuropathic pain.
